To Boldly Install What No Student Has Installed Before: A Guide to Installing Chaste

Callum Marples

12th June 2025

This guide explains how to install the Chaste simulation framework on a WSL2 Ubuntu environment. The process draws on information from several online resources.

1 Prerequisites

1.1 GitHub account

If you don't already have a GitHub account, create one at `https://github.com/`. This will be necessary to access the Notochord project later.

1.2 Install WSL2 and Ubuntu

Following the instructions in [1]:

- Open Windows Command Prompt in Administrator mode.

- Enter the command:

  ```
  wsl --install
  ```

- Restart the machine.

1.3   Set Up WSL Environment

Following the instructions in [2]:

- Open Ubuntu and create user account and password.

- Update package using:

  ```
  sudo apt update && sudo apt upgrade
  ```

- Configure git using the commands:

  ```
  git config --global user.name "Your Name"
  git config --global user.email "your_email@domain.com"
  ```

  replacing `Your Name` and `your_email@domain.com` with your name and email address.

2   Installing Chaste

Following the instructions in [3, 4, 5]:

2.1   Provide Linux Distribution With Enough RAM

- Open File Explorer and navigate to

  ```
  C:\Users\<YourUserName>
  ```

- Create an empty file with the name ".`wslconfig`"

- Open the file (e.g. with Notepad) and add the following:

  ```
  [wsl2]
  memory=4GB
  processors=4
  ```

2.2 Obtain and Run `chaste_install.sh`

- Open Ubuntu and run the following commands:

  ```
  git clone https://github.com/cmarples/ChasteSetup
  cd ChasteSetup
  ./chaste_setup.sh
  ```

  This will obtain and run a Bash script designed to install and build Chaste, automating much of the process. Note that this step can take a long time (about 45 minutes, depending on the machine).

3 Installing the `NotochordElongation` Project

The Notochord vertex model code is currently in a private GitHub repository. To clone this from GitHub:

- Accept invitation on GitHub (`https://github.com/`).

- In Ubuntu, run the command:

  ```
  ssh-keygen -t ed25519 -C "your_email@domain.com"
  ```

  replacing `your_email@domain.com` with your email address. Then run:

  ```
  eval "$(ssh-agent -s)"
  ssh-add ~/.ssh/id_ed25519
  cat ~/.ssh/id_ed25519.pub
  ```

- Go to `https://github.com/settings/keys`, click New SSH Key and create the key, pasting in the key output from the last command.

- In Ubuntu, run the command

  ```
  ssh -T git@github.com
  ```

- Can now clone the NotochordElongation project using the commands:

```
cd ~/Chaste/Chaste/projects
git clone git@github.com:cmarples/NotochordElongation
```

- Finally, build and run the Notochord vertex model by using the commands:

```
cd ~/Chaste/Chaste/projects/NotochordElongation
./scripts/full_build_and_run_notochord_simulation.sh
```

If everything has gone to plan, then a folder called Test_Notochord_Installation should have been created in the Chaste/output directory. If it has, then you have successfully installed Chaste and the NotochordElongation project!
